CSN: 960 - 2064 - 000R

The WAVE router functions are controlled through a web GUI.

To set the IP address for the first time you will use dip switches.  Gently remove the plastic bezel from the router and you will see a label like the one above.  Your label information will have different MAC numbers and values than the label shown in this example.

**1** Set the dip switches to one of the factory forced IP addresses.  Reboot the router.  Open a browser on your computer and type in the factory IP address you chose with the dip switches.  Press ENTER.  The WAVE Router GUI should load.

Go to the SETTINGS TAB  [⚙ Settings]  - select IP Settings.  You should see the factory IP number you chose with the dip switch setting.

**2** If desired, obtain a static address from your System Administrator.  Change the dip switch settings to *IP User Selectable*.  Use the web GUI to set the static address as needed for your environment.

\* Reboot the router anytime you change dip switch settings.
